TODO LIST SERVICE

Create a Todo List service in Golang. The service should expose an API to allow for (fictional) frontend code to connect. Frontend is not required in this assignment. The service should have the commonly expected features like due date, labels and comments. Consider what other additional features would be useful to have.

The service would be deployed in a cloud environment. Create a deployment strategy and optionally include Docker deployment manifests for this service.

We would like to discuss your solution approach in the following interview. We would like to discuss how we can improve the solution beyond the base requirements.
